Good Buildings Deserve Good Hardware

COLONIAL AND EARLY ENGLISH HARDWARE

ALTHOUGH the title of this book is "Colonial and Early English Hardware" it will be found to contain a wide and comprehensive range of designs. At the time of its first edition, these architectural styles were predominate — and still are in point of actual use — but there has since been a growth in the tendency to employ the characteristics of the Spanish and French.

The so-called Mediterranean style has developed, combining the Italian and Spanish and has rapidly gained favor, especially in the warmer climates. One also notes, in the adaptations and diversifications of other styles an effort to create distinctive buildings.

These conditions have prompted the inclusion of the many designs to be found herein. The general line, however, will continue to be known by its original title, under which it has gained a most valuable reputation.

The use of studs, as shown, was common on the old batten or slab type doors and today adds a striking touch of realism. Studs No. 7657 (shown on p. 47) were used on this door.

Introduction

DEVELOPMENT of Colonial and Early English Hardware to its present scope, as presented in this edition, has closely followed the swing of architecture to the styles of traditional America and Europe. First indications of a widespread enthusiasm for buildings in these styles found Corbin prepared to make available a new and distinct type of hardware, interpreting the work of the blacksmith hardware-maker of olden times.

With a first hand knowledge of modern builders' requirements and an acquired intimacy with the products and methods of the old craftsmen, pieces were carefully chosen from among the best known patterns of Early America and Europe, for reproduction. The interesting crudities and irregularities of the originals were religiously preserved. The atmosphere of the forge, the romance of iron and laborious methods of hand work, inseparably mingled in the products of the early iron worker, were portrayed with remarkable faithfulness, and with a restraint and absence of exaggeration that is truly fine.

Yet, in matters of mechanical function, modern standards of practicality have been ingeniously maintained. Butts and hinges work freely and without creak or groan. Thumb latches do not rattle. Catches and fasteners operate smoothly. Handles and knobs are made for use with modern, secure locks. For while architects and builders have unfolded before us the charm and beauty of these styles, there is no inclination toward a backward step from modern ideals of efficiency, comfort or convenience.

Architecture has constantly expanded the possibilities of creating distinctive buildings, employing new and unexplored phases of the old styles, or as is frequently done, combining two or more in a single, charming house. Corbin keeps apace adding new designs to suit new trends, and adopting new items found necessary to a complete hardware equipment.

In this edition of Colonial and Early English Hardware a wide range of patterns is offered, each strongly suggestive of a particular architectural style. The simple forms of the Colonial are distinct from the delicate traceries of the Spanish and the more detailed elaborations of the English and French. In some instances though, it is extremely difficult to draw definite lines of classification because of the curious commingling of design motives in many of the old schools. However, each piece carries an unmistakable relation to traditional architecture and one may choose from several pat-

terns for any particular style with the assurance that each will reflect the spirit of its surroundings.

The hardware for entrance doors was easily the object of greatest consideration and effort with early workers of the trade. Hinges, knockers and door handles for these doors were ornamental in character, made to beautify as well as to serve a practical purpose. Today too, this part of the hardware equipment is of major importance. Many suggestions for selecting designs for the various types of entrances will be found in this book.

In most cases, the equipment for interior doors may be had in the same design characteristics as the hardware selected for the entrance door, although greater freedom in the use of thumb latches, knobs and escutcheons, H and HL hinges, etc., is possible when desired. All of the many items for cupboards, casements, shutters, etc., necessary for complete equipment, are available in Colonial and Early English Hardware, making possible a highly desirable consistency of treatment throughout the building.

FINISHES — PART I

The pieces in Part I of this catalog are made in colonium metal, bronze or brass. Colonium metal is a contribution of Corbin research to the craft of reproducing the old iron work to modern standards of practicality. It is a compound metal with the grayish color and rugged texture of iron, yet it is absolutely rustless. Through its use, damaging rust streaks on woodwork have been effectively eliminated. Wear will not change its appearance since the base metal furnishes the predominating color of the finish.

The ordering symbol for articles made in colonium metal and finished in a grayish, hand-hammered, half polished treatment is EH. This symbol should be prefixed to the number of the article.

When a simulation of the black finish, often applied to iron in the early days by dipping the hot metal in oil, or by painting it, is wanted, the symbol DH should be prefixed to the number. The articles are then made in bronze and treated with a durable, black coating.

Brass or bronze, when treated in the manner of colonium metal, takes on a beautiful, rich color and shows, with striking effect, the interesting marks of the finishing hammer. Pieces in Part I will be furnished in hand-hammered, antique bronze when the symbol BH is prefixed to the number, or in brass when indicated by the symbol AH.

Hardware for the Entrance Doors

8

SOMERSET

(See page 16)

A dignified, well defined design which carries the unmistakable flavor of the stately English manorhouse. It is suggested for the more pretentious buildings in the English styles.

MAYFIELD

(See page 18)

Somewhat similar to Somerset in its principal motif, yet worked out with a little more of reserve and grace and less elaboration. This simpler design is well suited to the more modest cottage types of homes.

Hardware for the Entrance Doors

9

LAVERSTOCK

(See page 19)

The ornate scroll of these hinge plates and escutcheon offers a splendid means of relieving an entrance which may otherwise be too plain. A door knocker may of course be selected if desired.

SHREWSBURY

(See page 20)

This design fits well into a setting of Gothic features. Its rugged contour imparts an impression of strength without unnecessary bulk.

Hardware for the Entrance Doors

10

MARLBORO

*(See page 20)*

For the modern versions of old architecture, a simple, unpretentious design is often best. Marlboro is adaptable to many buildings of these types.

CONCORD

*(See page 21)*

An adaptation of an old colonial motif especially fitting for the early New England type of house.

Hardware for the Entrance Doors

11

STOCKBRIDGE

(See page 22)

An artistic and pleasing variation of the "blown-tulip" pattern, popular in colonial times. The added elaboration enhances the appearance of an otherwise plain door.

POTTSVILLE

(See page 21)

This was one of the most widely used patterns in all the colonies. It is known as the "bean" motif because of the bean-shaped cusp of the handle.

Hardware for the Entrance Doors

12

PLYMOUTH

(See page 23)

Colonial designers got their inspiration for this simple pattern from the Indian arrowhead. It adds an unmistakable atmosphere of authenticity to any colonial type entrance.

MONTGOMERY

(See page 22)

This design is indeed simplicity in itself, yet by its lack of affectation it is true to the work of the early blacksmiths.

Hardware for the Entrance Doors

13

DOUVAINE

(See page 23)

The flourishing finials of hinge plate and handle suggest the spirit of French design. This pattern is perhaps best suited to buildings in the French styles.

MONTREUIL

(See page 24)

This design is suggested for use with the heavy, half-timber work of Norman architecture. Its well modeled sturdiness is especially appropriate for such a setting.

Hardware for the Entrance Doors

14

PAMPLONA

(See page 24)

Pamplona design is distinctly Spanish. It portrays the delicate tracery that is so characteristic of Spanish iron work.

SEVILLE

(See page 25)

Another design that is well suited to the building of Spanish architectural features, or the Spanish-Italian Mediterranean style.

Hardware for the Entrance Doors

15

TERRANOVA

(See page 25)

Suggested as befitting the Mediterranean type of architecture. The intricate, tooled and perforated design and twisted handle grip are exceptionally appropriate for this style.

BURGOS

(See page 26)

The illustration shows how well this design may be used to add interest to an entrance which is without architectural embellishment.

Part II

Early American Wrought Iron Hardware

IN a search for the truly representative patterns of the wrought iron hardware of early America, one cannot help but feel that there was great ingenuity and originality among the blacksmiths of all the colonies. It would seem a task almost impossible of accomplishment, to establish for each individual design, the place and date of its origin, or the particular craftsman on whose forge it was produced.

But with an exhaustive study of the vast store of specimens and information available to us in the historical institutions of the country, in the old buildings which still stand and in the works of devoted students of the subject we are able to sense several distinct motives of design which underlie an overwhelming proportion. It becomes increasingly evident that many patterns are merely artistic variations of an original or master motif. It is possible in many cases to name the general section in which a particular motif rose to its greatest popularity and probably found its origin, as the work of an inventive blacksmith.

And so, in selecting a representative group of patterns for reproduction, Corbin has considered only those which can be definitely established among the authentic and popular motifs of the times. Those which are found to have been too limited in the scope of their use have been eliminated as have others which might be considered of a freakish or inartistic nature.

That the "ensemble" idea in design was not in vogue among the colonists is at once apparent. The door handle, hinges, and door knocker seldom were in matched design. Rather, there seems to have been prevalent, a tendency toward the use of pieces which were independent of each other, though the range of design among the knockers and hinges is not as wide in variety as that of the door handles.

On the pages which follow, the Corbin reproductions will be found in groups as they might be used—in a sort of pleasing compromise between modern uniformity and authentic

individuality. One need not feel limited to their use in this manner however, for the pieces may be chosen to suit the ideas and tastes of the user. Electric push buttons have been added for modern efficiency where wanted.

Each piece is individually forged by hand from heated iron. The surface and contour of the articles vary slightly in appearance, due to the method of manufacture, but are reasonably uniform in size so that the dimensions given should be sufficient for ordinary applications.

FINISHES

Two finishes are provided—dead black, designated in ordering by the symbol DD, and half polished, symbol HD. Either finish can be supplied on all articles except No. 3988 Garage Bolt, No. 3 Garage Door Holder and No. 200 Garage Door Lock, which are made in a dead black finish only and which should be ordered by prefixing the symbol D.

Although the designs in this section are selected from early American patterns, it is entirely within the limits of good taste and judgement to use some of them on buildings which are not strictly early American in their predominant motives, but combine as well, architectural features of foreign lands, for many of the colonial designers took their inspirations from abroad. Undoubtedly, the greatest foreign influence on early American patterning was brought from England aboard the ships of the pilgrims. Too, there are early records to be found, which tell of the imports of wrought iron thumb-latches of the "bean type" (Branford Design, page 66) from that country. And to illustrate the manner in which new motifs sometimes found their way into colonial patterns, we have the crescent (Turkish) combined with the ball and spear (Colonial). The originals were found in towns along the Connecticut River and are believed to be the result of the visit of some sea-faring adventurer to the Orient. (See Hartford Design, page 63)

Hardware for Entrance Doors

56

COLCHESTER

(See page 62)

A handle of the "sword-fish" pattern, found frequently in Connecticut and Massachusetts. Known to have been made between 1780 and 1800. The hinge plates are similar in design.

HARTFORD

(See page 63)

The "ball and spear" motif with crescent below was a product of the artistic and imaginative smiths of the Connecticut Valley. The door handle and knocker are both of this pattern. Hinge plates are similar.

Hardware for the Entrance Doors

57

HAVERHILL

(See page 64)

The "arrowhead" pattern widely used throughout the colonies. A specimen of this type is found in the home of John Greenleaf Whittier at Haverhill, Mass., built in 1760.

DOYLESTOWN

(See page 65)

A favorite of the German settlers of Pennsylvania was this "heart" design, although there is ample evidence of its use in widely scattered sections.

LANTERNS

LOCKS
AND
LATCHES

Hardware for Entrance Doors

58

BRANFORD

(See page 66)

The "bean" type, perhaps the most common of all colonial patterns, so called because of the resemblance of the cusps of the handle to a lima bean. Made both in this country and imported in Pre-Revolutionary days.

LEXINGTON

(See page 67)

A variation of the "arrow-head" termed the "notched arrowhead". Specimens of this type, made as early as 1698 are still in existence. Both door handle, and hinge plates are similar in design.

Hardware for the Entrance Doors

59

LAHASKA

(See page 68)

A door handle of the "ball and spear" motif, combined with hinge plates of the "notched arrowhead" and the "four leaf" door knocker offers a trim with pleasing diversity of pattern.

HILLSDALE

(See page 69)

This phase of the "tulip" motif was popular in the Housatonic Valley and in Pennsylvania, particularly with the Dutch settlers of the eighteenth century.

LANTERNS

LOCKS
AND
LATCHES

Hardware for the Entrance Doors

60

WEST CHESTER

(See page 70)

The date and origin of this pattern are not definitely known; however it is evidently the master motif for other pieces of marked resemblance produced in Pennsylvania.

BRONCK

(See page 71)

This "spearhead" design, although somewhat like the "arrowhead" has its own characteristics, for it is longer and has the appearance of graceful slenderness. A variation which can easily be called artistic.

Hardware for Entrance Doors

61

HADDAM

(See page 73)

The "tobacco leaf" pattern, found on the buildings of the rich tobacco lands of the Connecticut Valley and in Southern Massachusetts. There are still several interesting examples of this pattern in use.

WETHERSFIELD

(See page 72)

A Norfolk type door handle of early design, with only slight attempt at ornamentation. The door knocker is of a similar pattern while the "notched arrowhead" hinge plates offer an authentic variation.

EARLY AMERICAN AND TRADITIONAL LANTERNS

THE quaint, interesting reproductions of old lanterns on the following pages are inseparably a part of the American Colonial and traditional European dwelling. In days of old they played an important role in domestic life, shining from their hangers as beacons to guide footsteps over winding paths, or occupying the center of activities during long evenings of close companionship. Today, they are the finishing marks of reality for modern buildings portraying the styles of early America and Europe. Applied at the entrances, they fix the stamp of authenticity to the exterior. In interiors, they may be hung by a fireplace, over a mantel, suspended from the ceiling or attached to the wall, to add that elusive atmosphere that somehow emanates from the ironwork of the old blacksmith.

These lanterns are made for use with modern electricity and serve a practical as well as an ornamental purpose. Unless otherwise noted in the description, lanterns are furnished without sockets or wiring. Lanterns with wall brackets are furnished with wood and machine screws and with a

standard spider for attaching where required. Ceiling fixtures are furnished regularly, only where illustrated. Two finishes can be provided; DD or dead black and HD, half polished. When furnished in DD finish the lanterns are made in copper and when finished in HD, they are made in zinc.
